TONINO → Emmetu → translated and forwarded
to Helge Kvåvik at EB

We have replaced the:

1. Timing and Frequency Unit
2. 5 MHZ Reference Oscillator

by the new spare parts sent to us. This did not bring any change to make the terminal operational.

Our understanding is that:

1. Stand-by heating batteries does not look damaged
2. Charging circuit for batteries is the one damaged because there is an indication of burns
3. Wiring for stand-by heating system looks ok
4. Thermo glass bulb does not look damaged because the Reference Oscillator is in good condition

Suggestion

Since the spare TFU sent to us is not like the original because it is without stand-by heating facility (charging circuit) our suggestion is that if a shipment of this part, just like the original, is made we could expect a result or at least we would have a better chance to pin-point the cause of the problem.

Best Regards,
